

The figure consists of 12 vertical grayscale images arranged in a single row. Each image shows a person's head and neck from the side, with the neck and shoulder area highlighted in a darker shade. The sequence of images illustrates a range of motion, likely for a biomechanical study. The first image on the left shows the head in a neutral, forward-facing position. As the images progress from left to right, the head tilts increasingly backward, reaching a full range of motion by the final image on the right. The background is a light, uniform gray.
